

# The State AI of OffSec

*What the future of offensive threats will look like.*

Brandon Veisoh, CEO & Co-founder @ MindFort.ai

# AI is at an inflection point

- Models are much better
- Agents are actually useful
- Progress is speeding up
- Can work for hours
- Access to open models

# The coming wave

- Autonomous complex exploitation and discovery
- Always running
- Massive parallelization
- Attacks become cheap

# Autonomous attacks are starting to happen

**\$ 4.88M↑**  
Avg. cost of data  
breach

# Traditional Defense Can't Keep Up

## DAST/SAST

- No business logic capabilities
- Can't chain exploits, doesn't truly simulate real attackers
- Miss critical interactions with your infrastructure
- High false positive rate

## Human Pen Testing

- Done annually, lot of ops overhead
- Expensive - \$15-65k per engagement
- Limited Scope - they only have so much time

# Patching is a bottleneck

Critical vulnerabilities take **137 days** to patch.

***With AI, attackers exploit them in minutes.***

**The gap between has to close.**

- How are defenders adapting?

- Replacing their DAST/SAST and pen testing with AI Agents, testing in runtime, continuously.

# Start building your own AI attackers

- Coding harnesses
- Open models
- Loops

The future is bright, if we act  
**now.**
